Smart zoom

In some circumstances you may wish to disable smart zoom in browser applications such that double tapping will not trigger smart zoom.

To cater for this we have introduced a setting called 'gesture web browser disable smart zoom' that when set will disable smart zoom.

This can be set using the command: upddutils nodevice set "gesture web browser disable smart zoom" 1

The browser application should be added to the list of web browsers.

With this setting in place you can use single touches to scroll and navigate in the browser without double tapping causing a smart zoom. It also improves the responsiveness of single taps as UPDD Gestures does not need to wait for a short period of time to see if a second tap is going to occur before allowing a single tap to generate a mouse click.
